### Op Amps Problems And Solutions

outputs of the op amps by  $v_{o1}$  and  $v_{o2}$ , we immediately infer that  $v_{o1} = R_1 + R_2 R_1 v_{in}$  and  $v_{o2} = R_4 R_3 v_{in}$ . If you do not see this, you can also write nodal equations at the noninverting inputs of the op amps after applying the golden rules. Now the output  $v_o$  is given by the difference of the above two voltages:  $v_o = v_{o1} - v_{o2} = R_1 + R_2 R_1 + R_4 R_3 v_{in}$

When working with op-amps, always remember an op-amp will adjust the output to keep the two input terminals at the same potential. So in this case without knowing the supply voltage(s) it's pretty simple problem:  $V_+$  is 2V ( $3 * 8K / [4K + 8K]$ ) Therefore  $V_-$  is also 2V; Then  $2V = V_o * 2K / (5K + 2K)$ , or  $V_o = 2V * 7K / 2K = 7V$

Due to the voltage divider, the input voltages to the three op-amps are, respectively, 2.5V, 1.5V and 0.5V. The output of these op-amps are listed below for each of the input voltage levels. A digital logic circuit (a decoder) can convert the 3-bit output of the op-amps to the 2-bit binary representation.

### Analysis of Op-Amp Circuits

A more general way of solving any op amp circuit is to note that an ideal (and most real) op amps must satisfy the virtual short assumption, i.e. that  $V_+ = V_-$ . Using this assumption and KCL at an input node is adequate to solve most any op amp problem. In this case, KCL at the inverting input gives  $+ V_{in} / R_i - 0 - V_{out} / R_f = 0$ . Rearranging,  $V_{in} / R_i + V_{out} / R_f = 0$

The amplifier is then like a normal open-loop amplifier that has very high open-loop gain, and the amplifier is saturated. Thanks to a resistor in parallel of the capacitor, the circuit behaves like an inverting amplifier with a low frequency, and saturation is avoided.

Circuits with Op Amps The operational amplifier (op amp) is a complex nonlinear device with three distinct operating regions: a linear region, in which the output voltage is proportional to the difference between the two input voltages, and two saturation regions where the output voltage takes on either the positive power supply voltage or the negative power supply voltage.
