Line-of-sight is the direct propagation of radio waves between antennas that are visible to each other. This is probably the most common of the radio propagation modes at VHF and higher frequencies. Because radio signals can travel through many non-metallic objects, radio can be picked up through walls.

Radio Link engineering begins by doing a link budget analysis. A given radio system has a system gain that depends on the design of the radio and the modulation used. The gains from the antenna at each end are added to this gain. Larger antennas provide higher gain.

t. e. Radio propagation is the behavior of radio waves as they travel, or are propagated, from one point to another, or into various parts of the atmosphere. As a form of electromagnetic radiation, like light waves, radio waves are affected by the phenomena of reflection, refraction, diffraction, absorption, polarization, and scattering.
